INS

WHAT MAKES THE BRAIN “HEALTHY” ?

1. EFFICIENT COMMUNICATION AMONG AREAS

+

2. EFFICIENT RECONFIGURATION OF ACTIVATION

THE BRAIN CAN “ADAPT” TO A VARIETY OF STIMULI

MAGNETOENCEPHALOGRAPHY IN NAPLES

SOURCE RECONSTRUCTION

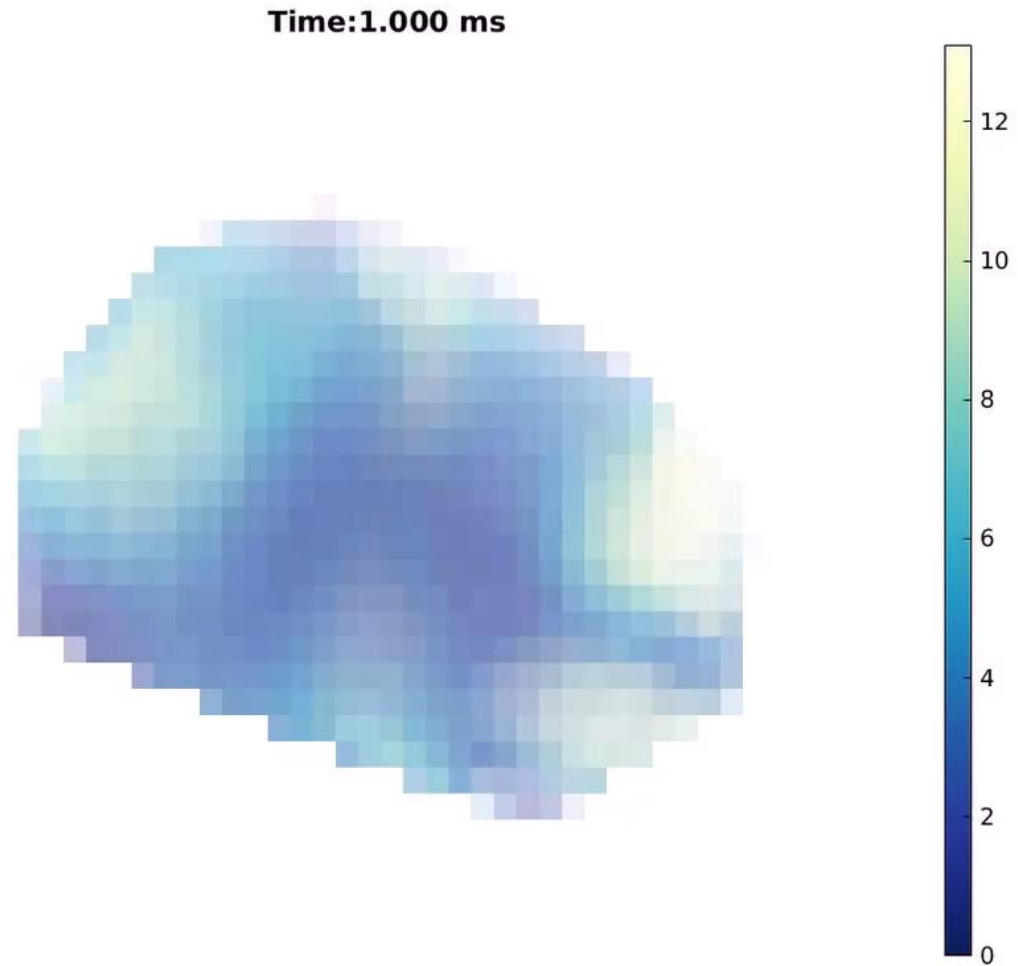

SENSOR LEVEL

BEAMFORMER

SOURCE LEVEL (AAL)

WHOLE BRAIN PROPAGATION OF ACTIVITY

AVALANCHE

- **Spatio-temporal fluctuations of the activity**

- **Starts:** when any area is active

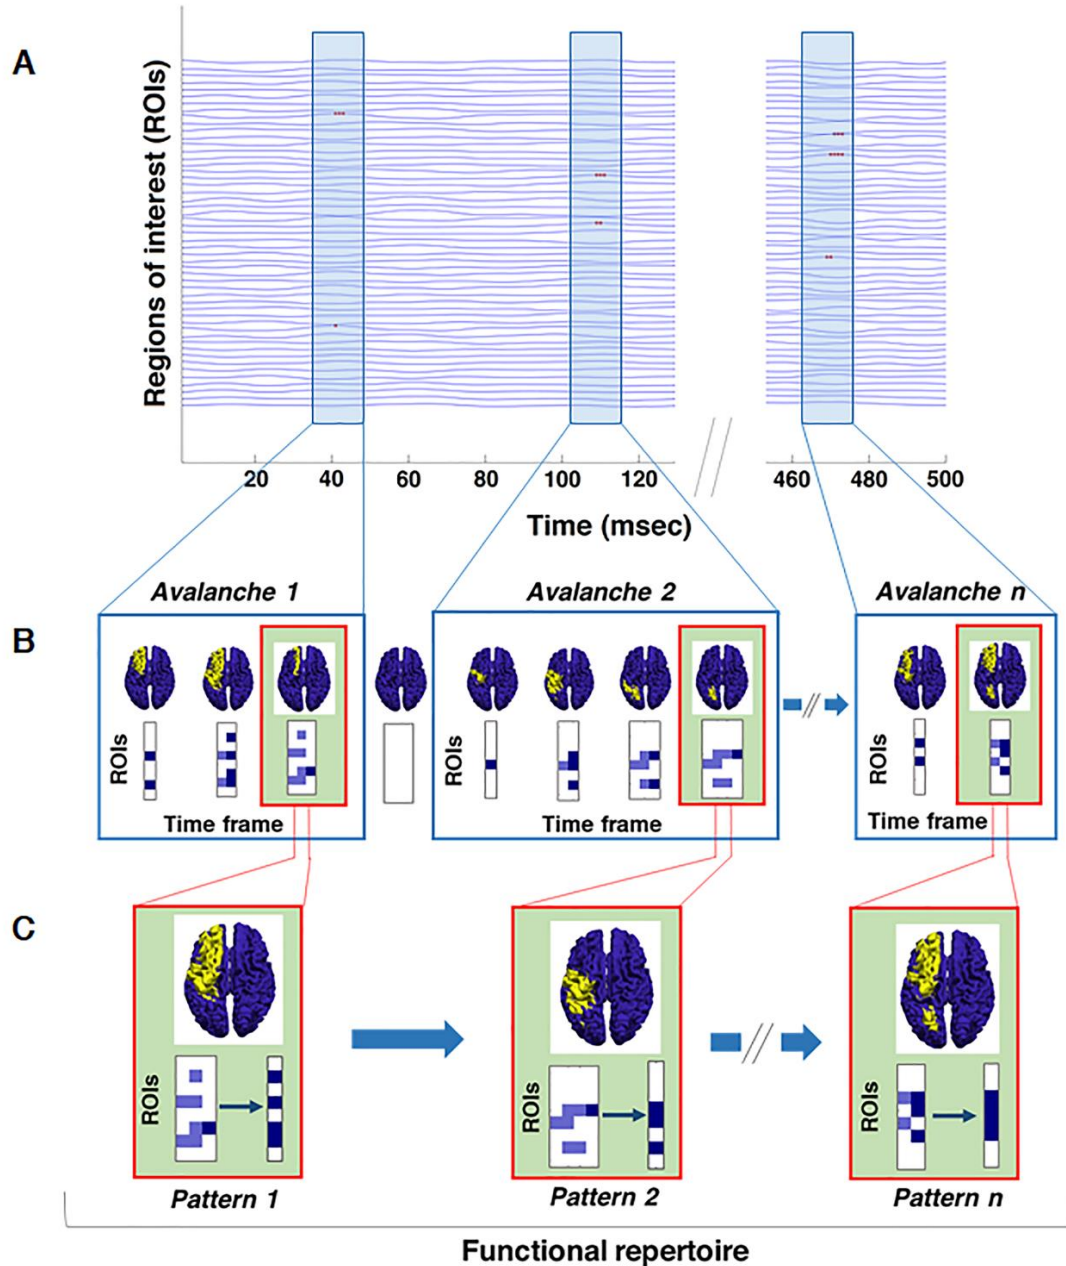

- **Stops:** when no area is active

- How do we define active ('an event')?

if the absolute value of the z-score of the intensity of the magnetic field, computed over all the intensities values of a channel throughout the whole acquisition, is > 3

Functional repertoire

Healthy dynamics

infer optimal parameter configuration where simulations match the experimental data

Cranmer et al. *PNAS* 2020

Hashemi, et al. *MedrXiv* 2022

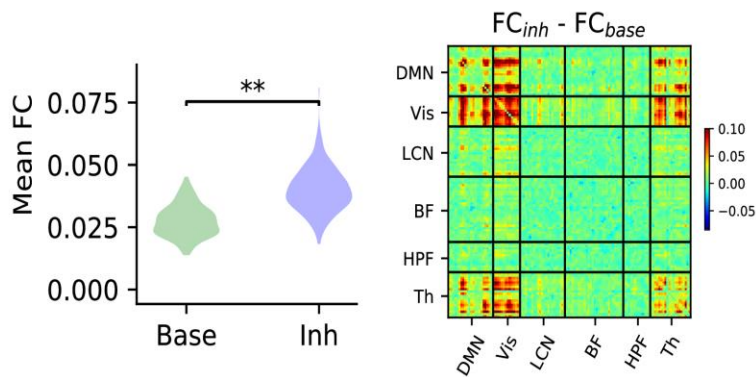

Effects of decreasing local excitability

- 100 baseline simulations VS 100 simulations with decreased RSC excitability:

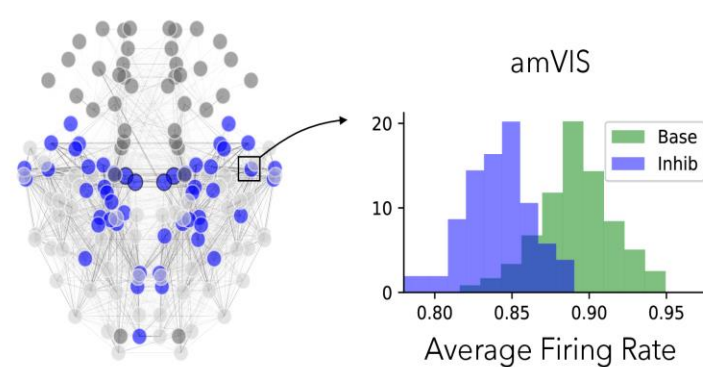

- Results:

1. BOLD over-connectivity

2. Firing rate decrease in subnetwork

3. Increased slow frequencies

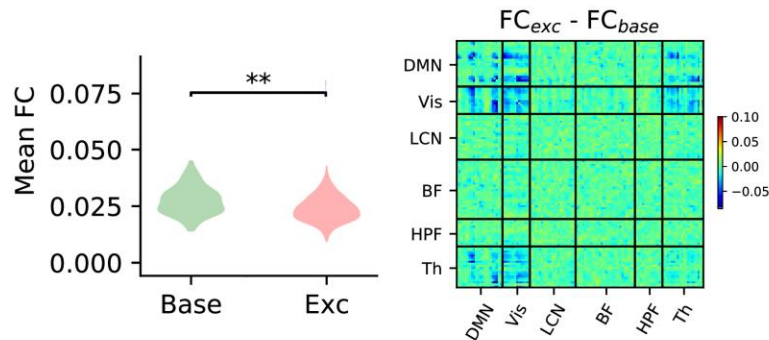

Effects of decreasing local excitability

- 100 baseline simulations VS 100 simulations with increased RSC excitability:

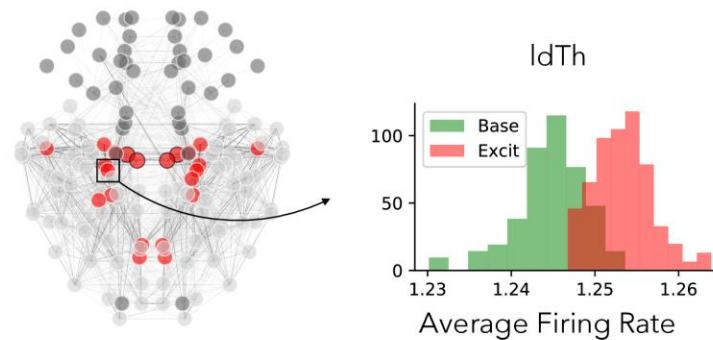

- Results:

1. fMRI hypo-connectivity

2. Firing rate increase in subnetwork

3. Decreased slow frequencies

- Increased local excitability explains our observations! ⇒ Lesion and DREADD increased overall excitability

Take home

- Focal silencing (Lesion and DREADD) caused drop of global FC

- The FC drop was due to an impaired capability of bursting

- Bursts are building blocks of FC and depend on local activity

- Virtual brain models confirm previous results, allow to interpret new data, and make predictions
